Art Unit: 1614 Phone Number 308-4650 Serial Number: 101030-886
Mail Box and Bldg/Room Location: CM-2A17 Results Format Preferred (circle): PAPER DISK E-MAIL

If more than one search is submitted, please prioritize searches in order of need. *MEJ*

Please provide a detailed statement of the search topic, and describe as specifically as possible the subject matter to be searched. Include the elected species or structures, keywords, synonyms, acronyms, and registry numbers, and combine with the concept or utility of the invention. Define any terms that may have a special meaning. Give examples or relevant citations, authors, etc, if known. Please attach a copy of the cover sheet, pertinent claims, and abstract.

Title of Invention: _____

Inventors (please provide full names): Riccardo Losca

Earliest Priority Filing Date: _____

For Sequence Searches Only Please include all pertinent information (parent, child, divisional, or issued patent numbers) along with the appropriate serial number.

A composition comprising

1) ~~car~~ carvacrol

2) thymol

L17 ANSWER 1 OF 11 HCAPLUS COPYRIGHT 2002 ACS
ACCESSION NUMBER: 1986:596968 HCAPLUS
DOCUMENT NUMBER: 105:196968
TITLE: The volatile oils of some endemic Thymus species growing in southern Anatolia
AUTHOR(S): Mericli, Filiz Ilisulu; Tanker, Mekin
CORPORATE SOURCE: Fac. Pharm., Istanbul Univ., Istanbul, 34452, Turk.
SOURCE: Planta Med. (1986), (4), 340
CODEN: PLMEAA; ISSN: 0032-0943
DOCUMENT TYPE: Journal
LANGUAGE: English
AB The volatile oil contents and the **compn.** of the oils from 4 Thymus species, *T. cilicicus*, *T. revolutus*, *T. sipyleus*, and *T. zygioides* grown in Turkey were investigated. Only *T. zygioides* contained thymol [89-83-8] in considerable quantities (24.62%). The *T. cilicicus* oil was rich in .alpha.-terpineol [98-55-5] (33.4%) and camphor [76-22-2] (8.3%), *T. revolutus* oil in .alpha.-terpineol (30.46%) and *T. sipyleus* oil in geranial [141-27-5] (32.11%). The latter oil contained no thymol nor carvacrol [499-75-2].

ACCESSION NUMBER: 1986:502324 HCAPLUS

DOCUMENT NUMBER: 105:102324
 TITLE: Study of essential oils of two species of Moroccan
 origanums (*Origanum compactum* Benth. and *Origanum*
elongatum Emb. et Maire)
 AUTHOR(S): Benjilali, B.; Richard, H. M. J.; Barिताux, O.
 CORPORATE SOURCE: Sect. Technol. Aliment. Nutr. Hum., Inst. Agron. Vet.
 Hassan II, Rabat, Morocco
 SOURCE: Lebensm.-Wiss. Technol. (1986), 19(1), 22-6
 CODEN: LBWTAP; ISSN: 0460-1173
 DOCUMENT TYPE: Journal
 LANGUAGE: French
 AB Essential oils of *O. compactum* and *O. elongatum* grown in Morocco were
 steam distd. and then analyzed by gas chromatog.-mass spectrometry.
 Thirty-two compds., representing 90 to 98% of the total oil, were
 identified from 10 samples collected on wild planting of different geog.
 origins. Seven of them, .gamma.-terpinene [99-85-4], terpinen-4-ol
 [562-74-3], .alpha.-terpineol [98-55-5], p-cymene [99-87-6],
 carvacrylmethyl ether [6379-73-3], thymol [89-83-8] and
 carvacrol [499-75-2], represent 82 to 93% of the total oil and
 explain the important variations obsd. in the compn. between
 wild plantings.

ACCESSION NUMBER: 1986:502321 HCAPLUS
 DOCUMENT NUMBER: 105:102321
 TITLE: Chemical composition and variation of the essential
 oil from the Norwegian *Thymus praecox* ssp. *arcticus*
 and *Thymus pulegioides*
 AUTHOR(S): Stahl, Elisabeth
 CORPORATE SOURCE: Dep. Pharmacog., Univ. Hamburg, Hamburg, D-2000/13,
 Fed. Rep. Ger.
 SOURCE: Prog. Essent. Oil Res., Proc. Int. Symp. Essent. Oils,
 16th (1986), Meeting Date 1985, 157-61. Editor(s):
 Brunke, Ernst-Joachim. de Gruyter: Berlin, Fed. Rep.
 Ger.
 CODEN: 55BIAR
 DOCUMENT TYPE: Conference
 LANGUAGE: English
 AB Linalyl acetate [115-95-7] was the main component of oils from 52 *T.*
praecox ssp. *arcticus* plants. Six chemotypes were characterized by a
 different compn. of sesquiterpene alc. fraction; 5 were
 identical with an Iceland type but another one contg. T-cadinol
 [5937-11-1] was widespread in Norway. Of a no. of samples of *T.*
pulegioides oils, 2 different chemotypes were found: carvacrol [499-75-2]
 and thymol [89-83-8]. Metabolites of the
 terpene phenol biochem. pathway comprised 75% of the oil.

L20 ANSWER 1 OF 44 HCAPLUS COPYRIGHT 2002 ACS
 ACCESSION NUMBER: 2002:316016 HCAPLUS
 TITLE: Combined effect of nisin, **carvacrol** and **thymol** on the viability of *Bacillus cereus* heat-treated vegetative cells
 AUTHOR(S): Periago, P. M.; Palop, A.; Fernandez, P. S.
 CORPORATE SOURCE: Universidad Politecnica de Cartagena, Escuela Tecnica Superior de Ingenieria Agronomica, Dpto. Ingenieria de Alimentos y del Equipamiento Agricola, Paseo Alfonso XIII 48, Murcia, 30203, Spain
 SOURCE: Food Science and Technology International (London, United Kingdom) (2001), 7(6), 487-492
 CODEN: FSTIFZ; ISSN: 1082-0132
 PUBLISHER: Sage Publications Ltd.
 DOCUMENT TYPE: Journal

LANGUAGE: English

AB The influence of mild heat pretreatment on the **bactericidal** action of nisin, **carvacrol** and **thymol** on stationary and exponential phase cells of two *Bacillus cereus* strains was studied. **Carvacrol** or **thymol** concns. of 0.3 mmol/L had no **bactericidal** effect on unheated, and a minor effect on heated *B. cereus* cells either in stationary or exponential growth phases. Nisin (0.15 .mu.g/mL) alone decreased the viable counts in all cases (unheated and heated cells in stationary and exponential phase) although the two strains tested showed different sensitivity to this natural antimicrobial between them. When **carvacrol** or **thymol** were combined with nisin, it resulted in a greater loss of viability of heated cells than when nisin was applied alone. There was a synergistic effect of nisin and both essential oils with a mild heat pretreatment on the viability of *B. cereus* cells. This study pointed out the potential use of nisin alone and in combination with **carvacrol** or **thymol** applied after a mild heat pretreatment for preservation of minimally processed foods.

CODEN: OSZKAT; ISSN: 0472-8602

PUBLISHER: METE

DOCUMENT TYPE: Journal

LANGUAGE: Hungarian

AB The chem. compn. of essential oil from the flowering sprout of both garden thyme and wild thyme, native in Hungary, has been analyzed by means of GC, GC/MS methods. Their .alpha.- and .beta.-pinene, p-cymene, 1,8-cineol, linalool, borneol, **thymol** and **carvacrol** components have been identified. The main component in both varieties is the **thymol** (22.8-35.5%). The chem. characteristics of the essential oil of three feral species, native in Bulgaria, have been studied. The 73 value in the redox p.d. of the garden thyme herb shows significant antioxidant activity, and the 35% quantity of the phenolic **thymol** clearly refers to this free radical scavenger activity. The oil of thyme hindered in 100% the proliferation of gram-pos. **bacteria** even in the presence of blood. Significantly hindered also the gram-neg. **bacteria** (the *Pseudomonas* strains only moderately) and the proliferation of the thread- and pollutant molds. The resistance activity of **bacteria**, virus and molds is well known. Such behavior of **bacteria** never has been found by the authors in case of essential oils.

AB A majority of the beef cattle and swine in the United States is produced in confined facilities. This generates significant environmental pollutants from the waste produced, including global warming gases, odor, and pathogens. The objectives of this study were to control the fermn. activity and pathogens in cattle and swine wastes with antimicrobial plant essential oils. Anaerobic one liter flasks with a working vol. of 0.5 L were used to evaluate the effect of **carvacrol** and **thymol** on prodn. of fermn. gas, short-chain volatile fatty acids, lactate, and **bacterial** populations. In cattle waste, 1 g L⁻¹ each of **carvacrol** and **thymol** completely inhibited the prodn. of volatile fatty acids and lactate over 23 days. In swine waste, 2.5 g L⁻¹ **carvacrol** inhibited the prodn. of all volatile fatty acids. We conclude that these essential oils are effective in controlling livestock waste odor emissions and field studies are warranted.

AB Antimicrobial effects of essential oils extd. by steam distn. from Zataria multiflora and Thymus x-porlock, on E. coli and S. aureus were studied. Disc diffusion method was conducted to evaluate the zone of microbial growth inhibition at various concns. of the essential oils. The antimicrobial effect was also studied against three different concns. of microbial suspension to find out MIC (Minimal Inhibitory Conc.) and MBC (Minimal **Bactericidal** Conc.). The essential oils from the above plants were strongly **bactericidal** with that of Zataria multiflora being highly effective. Chem. compns. of the essential oils were analyzed by Gas Chromatog. and Mass Spectrometry (GC and GC/MS). Eleven common chem. compds. i.e. more than 50 % of the total chem. compn., were found at various concns. in both the oils, out of which nine were monoterpenes. Major components of essential oil of Zataria multiflora were **Carvacrol** (37 %), Ortho cymene (15 %) and Dodecane (9 %), and those of Thymus x-porlock were 1,8-Cineole (54.52 %), Sabinene hydrate (5.03 %) and **thymol** (7.89 %). With a view to the increasing limitations of the use of chem. antimicrobial agents and development of drug resistance, it seems necessary to switch onto the new harmless antimicrobial agents from natural sources.

AB Pharmaceuticals derived from the trunk, inflorescences, leaves, and small branches of *Lippia sidoides* Cham. are disclosed which can be used as fungicides, **bactericides**, and general antimicrobial agents. The phytotherapeutics can be used as infusions, mouthwashes, teas, dyes, aq. exts., EtOH exts, or as the essential oil of the plant. The active agents in the prepn. include **carvacrol**, **thymol**, and other components which synergize these phenolic compds.

AB **Carvacrol** and **thymol** in combination at 6.7 mM each completely inhibited the prodn. of short-chain volatile fatty acids and lactate from cattle waste in anoxic flasks over 23 days. Fecal coliforms were reduced from 4.6 .times. 10⁶ to 2.0 .times. 10³ cells per mL 2 days after treatment and were nondetectable within 4 days. Total anaerobic **bacteria** were reduced from 8.4 .times. 10¹⁰ to 1.5 .times. 10⁷ cells per mL after 2 days and continued to be suppressed to that level after 14 days. If the concn. of **carvacrol** or **thymol** were doubled (13.3 mM), either could be used to obtain the same inhibitory fermn. effect. We conclude that **carvacrol** or **thymol** may be useful as an antimicrobial chem. to control pathogens and odor in stored livestock waste.

DOCUMENT TYPE: Journal

LANGUAGE: English

AB Two samples of the essential oils from *Thymus herba-barona* Loisel (Labiatae) of Sardinian origin were chem. characterized and their antimicrobial activity evaluated, in comparison with *T. vulgaris* and *T. serpyllum* oils, on the basis of their min. inhibitory concns. (M.I.C.s) and of the contact times required to totally inhibit development of microorganisms. GC and GC/MS anal. showed that the main components of essential oils of *T. herba-barona* were **carvacrol** (75.4% and 73.0%), borneol (3.6% and 6.4%) and p-cymene (3.9% and 3.3%), while the percentage of **thymol** was very low (1.0% and 0.7%). Results of the antimicrobial investigation demonstrated that both oils possessed similar and relevant microbicidal activities, esp. against Gram+ **bacteria** (M.I.C.s range 0.125-0.500 mg/mL) and mycetes (M.I.C.s 0.125-0.500 mg/mL). At inhibitory concns., times required to kill microbial inocula (5-10 min) are comparable with those of chlorhexidine gluconate, an antiseptic with a broad range of antimicrobial activities. The strong activity of *T. herba-barona* oils is very probably due to the presence of **carvacrol**, which was found from our screenings to exhibit a similar antimicrobial activity. Our findings provide for a rationale basis of a possible utilization of this oil in fields requiring safe and cheap compds. with antiseptic and preservative properties, such as cosmetic, pharmaceutical and food industries.

AB The essential oil compn. of *Satureja cuneifolia* Ten., was analyzed with respect to samples picked in different vegetative stages in the region of Rotimlje (Stolac, Herzegovina). We did not find oil of a compn. characteristic of the *Satureja* genus. The researched species mostly did not contain either **Thymol** or **Carvacrol**. The antimicrobial effect of the oil was highly marked during the post - flowering period, esp. for the *Staphylococcus aureus* **bacterium**. Essential oil fungicidal activity was best marked on *Candida albicans* yeast during the flowering period. Picking this plant at the proper time can considerably increase its therapeutic effect.

AB Essential oils and their components are becoming increasingly popular as naturally occurring antimicrobial agents. In this work the chem. compn. and the antimicrobial properties of Thymus essential oils and of their main components were detd. Three essential oils obtained from different species of Thymus growing wild in Sardinia and a com. sample of Thymus capitatus oil were analyzed. The essential oil components were identified by GC/MS anal. The antimicrobial activity of the oils and components was detd. against a panel of std. ref. strains and multiple strains of food-derived spoilage and pathogenic **bacteria**, using a broth microdilution method. The GC/MS anal. showed that the major constituents of the oils were monoterpene hydrocarbons and phenolic monoterpenes, but the concn. of these compds. varied greatly among the oils examd. The results of the antimicrobial assay showed that essential oils extd. from Sardinian Thymus species have an antimicrobial activity comparable to the one obsd. in other thyme oils. It seems also confirmed that the antimicrobial properties of thyme essential oils are mainly related to their high phenolic content. Among the single compds. tested **carvacrol** and **thymol** were the most efficient against both ref. strains and food-derived **bacteria**. The results of this study confirmed the possibility of using thyme essential oils or some of their components in food systems to prevent the growth of foodborne **bacteria** and extend the shelf-life of processed foods.

AB The **antibacterial** activity of essential oils from 31 medicinal plants was tested against Staphylococcus aureus, Streptococcus pyogenes, Bacillus subtilis, Escherichia coli, Salmonella typhi and Pseudomonas aeruginosa. Cinnamon oil could inhibit all six of the **bacterial** strains with min. inhibition concn. (MIC) values of 312-2500 mg/L. Oregano oil and summer thyme oil could inhibit all strains except P. aeruginosa, with MIC values of 625-5000 mg/L. The GC/MS anal. of these essential oils indicated that cinnamaldehyde was the main component of cinnamon oil, while **carvacrol** and **thymol** were the main components of oregano oil and summer thyme oil, resp. The MIC values of cinnamaldehyde and **thymol** were 156-1250 mg/L and 156-2500 mg/L, resp.

 AB **Carvacrol**, (+)-carvone, **thymol**, and trans-cinnamaldehyde were tested for their inhibitory activity against *Escherichia coli* O157:H7 and *Salmonella typhimurium*. In addn., their toxicity to **Photobacterium leiognathi** was detd., utilizing a bioluminescence assay. Their effects on the cell surface were investigated by measuring the uptake of 1-N-phenyl-naphthylamine (NPN), by measuring their sensitization of **bacterial** suspensions toward detergents and lysozyme, and by analyzing material released from cells upon treatment by these agents. **Carvacrol**, **thymol**, and trans-cinnamaldehyde inhibited *E. coli* and *S. typhimurium* at 1-3 mM, whereas (+)-carvone was less inhibitory. Trans-Cinnamaldehyde was the most inhibitory component toward *P. leiognathi*. **Carvacrol** and **thymol** disintegrated the outer membrane and released outer membrane-assocd. material from the cells to the external medium; such release by (+)-carvone or trans-cinnamaldehyde was negligible. Of the tested components, **carvacrol** and **thymol** decreased the intracellular ATP pool of *E. coli* and also increased extracellular ATP, indicating disruptive action on the cytoplasmic membrane.

AB In order to screen for natural antimicrobial compds., we carried out halo tests filter paper disks against ten species of microorganisms at 500mg/mL of exts. obtained from about two hundred plants. Although most exts. were effective against **bacteria**, the methanol ext. of *Mosla chinensis* Maxim. (Hosoba-yamajiso in Japanese. Labiatae) proved highly inhibitory against not only **bacteria** but also yeast and fungi (Table 1). Partitioning between H₂O and three successive solvents, hexane, CHCl₃ and EtOAc, and MIC* testing against twenty-three species of microorganisms revealed the hexane fraction to exhibit the strongest antimicrobial activity. I.e., the MIC values with this fraction were found at the lowest concn. and comparison of the diam. of zone inhibition at the same concn., demonstrated the hexane fraction to exert the greatest effects against almost all species of microorganisms. Plants of Labiatae, esp. such as *Thymus*, *Origanum* and *Satureja* used as spices and food additives, contain essential oils, whose constituents such as **thymol**, **carvacrol** and eugenol are known to possess antimicrobial activity. A comparison of antimicrobial activities using the MIC test showed that the methanol ext. of *M. chinensis* was more inhibitory against all species of microorganisms than that of *Th. vulgaris*. In addn., **thymol** exhibited a wide spectrum of antimicrobial activities, similar to these for *M. chinensis* (Table 2). Hexane fractions from the leaves, stems flowers and roots of *M. Chinensis* collected during June to August, were analyzed by GLC in order to det. their volatile constituents, and **thymol** was detected in all fractions. The content of **thymol** in leaves, 4.43-13.03% was overwhelmingly higher than in other parts, and max. levels were obsd. in leaves collected in August (Table 3). Furthermore, antimicrobial activities of exts. detd. by MIC testing were proportional to the **thymol** content. In conclusion, constituents of the hexane fraction contg. essential oils, are the main factors responsible for antimicrobial activity of *M. chinensis*. The results further suggest the participation of **thymol** in inhibitory effects against microorganisms.

AB The essential oil prepd. by steam-distn. of the flowering aerial parts of *Thymus algeriensis* Boiss (Fam. Lamiaceae) growing wildly in Libya, was analyzed, for the first time, by capillary gas chromatog. coupled to mass spectrometry (CGC-MS). Individual components of the oil were identified by their retention times and mass spectra as well as comparison with published data or with ref. compds. Quant. detn. was carried out based on the peak area measurement. The study revealed that oxygenated compds. constitute 51.72% of the oil; being mainly the phenols: **carvacrol** (36.78%) and **thymol** (12.45%). Monoterpene hydrocarbons amounted to 48.2%, the main components being .beta.-myrcene (20.22%) and .alpha.-terpinene (10.66%). The oil exhibited significant antimicrobial activity against certain Gram pos. and Gram neg. **bacteria** as well as fungi.

AB Three *Origanum* essential oils, *Origanum vulgare* ssp. *hirtum*, *Origanum dictamnus*, and a com. available *Origanum* oil, were analyzed by gas chromatog.-mass spectrometry (GC-MS) and showed a high content of **carvacrol**, **thymol**, .gamma.-terpinene, and p-cymene representing 73.7%, 92.8%, and 87.78% of the total oil, resp. The three essential oils exhibited high levels of antimicrobial activity against eight strains of Gram-pos. and Gram-neg. **bacteria**. Among the major components of the three oils, **carvacrol** and **thymol** exhibited the highest levels of antimicrobial activity, while their biosynthetic precursors .gamma.-terpinene and p-cymene were inactive. The essential oil of *O. vulgare* ssp. *hirtum* was extremely **bactericidal** at 1/4000 diln. and even at dilns. as high as 1/50000 caused considerable decrease in **bacterial** growth rates. The same essential oil also exhibited high levels of cytotoxicity against four permanent animal cell lines, including two derived from human cancers.

AB The viable counts of *Salmonella typhimurium* on nutrient agar (NA) decreased upon the addn. of either the essential oil of thyme or its constituent **thymol**, esp. under anaerobic conditions. Antagonistic effects of **thymol** against *Staphylococcus aureus* were also greater under anaerobic conditions. In contrast to the phenolic constituents of the oil, **thymol** and **carvacrol**, the chem. related terpenes p-cymene and .gamma.-terpinene had no antagonistic effects against *Salm. typhimurium*. The addn. of Desferal to NA counteracted the **antibacterial** effects of both thyme oil and

thymol. No support was obtained, however, for a possible role of iron in the oxygen-related **antibacterial** action of the thyme oil and **thymol** or for the obsd. effect of Desferal. In the presence of **thymol**, the viable counts of *Salm. typhimurium* obtained on a minimal medium (MM) were lower than those obtained on NA. Addn. of bovine serum albumin (BSA) neutralized the **antibacterial** action of **thymol**. It is suggested that the effects of BSA or Desferal are due to their ability to bind phenolic compds. through their amino and hydroxylamine groups, resp., thus preventing complexation reactions between the oil phenolic constituents and **bacterial** membrane proteins. This hypothesis is supported by the marked decrease in the viable counts of *Salm. typhimurium* caused by either thyme oil or **thymol** when the pH of the medium was changed from 6.5 to 5.5 or the concn. of Tween 80 in the medium was reduced.

AB The essential oils of *T. broussonettii*, *T. zygis*, and *T. satureioides*, which were produced from plants collected in Morocco, were analyzed by gas chromatog. The oil of *T. broussonettii* was rich in **carvacrol** (53.3%), p-cymene (13.5%), and .alpha.-pinene (8.6%). The abundant compds. in *T. zygis* oil were p-cymene (50.6%), **carvacrol** (8.1%),

borneol (5.8%), camphene (5.4%), .alpha.-pinene (5.2%), and **thymol** (5%), while the oil of *T. satureioides* contained borneol (31.2%), camphene (27.4%), .alpha.-pinene (17.5%), and linalool (6.3%) as major components. Examn. of the antimicrobial activity of the oils against 3 **bacteria**, 2 yeasts, and 2 molds revealed that the oil of *T. brousseonettii* was the most efficient in both killing the microorganisms and inhibiting their growth. The other 2 oils were much less active even though *T. zygis* oil possessed slightly more antimicrobial activity than *T. satureioides* oil. Among the **bacteria** examd. *Escherichia coli* was more resistant than *Staphylococcus aureus* and *Bacillus megaterium*, both in growth inhibition and destruction trials. *S. aureus* was more resistant than *B. megaterium* to the inhibitory effect, but more sensitive to the lethal activity of the oils. The 2 yeasts *Saccharomyces cerevisiae* and *Candida albicans* were identical in their sensitivity towards the 3 oils, while the mold *Zygorrhynchus* sp. was more sensitive than *Aspergillus niger* to growth inhibition and destruction. To growth inhibition, the molds were more sensitive than the yeasts and the **bacteria**, but *A. niger* was more difficult to destroy than the most resistant **bacterium** *E. coli*.

DOCUMENT TYPE: Journal
LANGUAGE: Serbo-Croatian

AB The contents of essential oil and phenolic compds. were detd. in the genera *Thymus* and *Satureja*, namely: *T. vulgaris* (1st and 2nd cut), *T. serpyllum*, *S. horvatii* and *S. hortensis*. *S. horvatii* had the highest content of essential oil (2.95 mL/100 g). The highest content in *T. vulgaris* was in 2nd cut (1.62 mL/100 g), while in the 1st cut it was 1.26 mL/100 g. The **thymol** content in *T. vulgaris* was higher in the 1st (60.86%) than in 2nd (42.31%) cut, which was not the case with **carvacrol**. In comparison with thyme, the essential oil of *T. serpyllum* had a low content of **thymol** (3.43%) and much higher of **carvacrol** (18.05%). In respect of the contents of **thymol** and **carvacrol** *S. horvatii* was similar to thyme, whereas the essential oil from *S. hortensis* had the highest content of

carvacrol (40.02%), and it contained only traces of **thymol**. In view of the relatively high contents of **thymol** and **carvacrol** in the essential oil of *Thymus* and *Satureja*, and taking into account the fungicidal and **bactericidal** action of these compds., their use in the pharmaceutical industry is justified.

AB Eight essential oil components added to growth media at concns. ranging from 50 to 400 ppm were studied with respect to their inhibitory effects against 10 common food-borne **bacteria** at 2 inoculum levels. The growth of the **bacteria** in culture media contg. 50 ppm **carvacrol** or 100 ppm cuminaldehyde with 2.0% NaCl, 0.05% ascorbic acid, or 0.5% sucrose in various combinations was also detd. Of essential oil components tested, **carvacrol**, **thymol**, and cuminaldehyde were inhibitory at some concns., except against *Pseudomonas aeruginosa*. The inoculum level had little effect on the inhibition. Pair combinations were not effective on any **bacteria**. **Carvacrol** or cuminaldehyde, when used in combination with NaCl and ascorbic acid, exhibited an enhanced inhibitory effect on certain **bacteria**. Thus, some combinations completely inhibited the growth of *P. aeruginosa*. *Bacillus cereus* also showed some sensitivity to these combinations.

AB A dental material for fighting cavities and periodontal disease consists of a combination of **thymol** and/or **carvacrol** and chlorhexidine and/or their pharmaceutically acceptable salts in a dental material carrier. These materials are useful as tooth lacquers or as dental cements of similar materials which have a long residence time in the oral cavity. Kolophonium (3 g) was mixed with 96% EtOH, the mixt. shaken for 24 h in a closed flask, 2 mL H₂O added with **thymol** 0.1, chlorhexidine 0.02, and NaF 0.01 g. The mixt. was shaken, and the obtained lacquer stored at room temp. Cariotic cattle teeth were prepd. by storing healthy teeth for 14 days at 37.degree. in soln. contg. 6 wt.% CM-cellulose (pH 4.5). After removal, the teeth were washed and dried. When the lacquer was applied to these cariotic cattle teeth as well as to

healthy cattle teeth, and the knoop hardness (500 g load) of the dentin measured, the healthy tooth dentin hardness did not differ significantly from the hardness values obtained by testing uncoated healthy teeth, whereas the dentin hardness of the cariotic teeth was markedly increased by lacquer treatment.

AB Twenty-five terpenoids (essential oils) were shown to inhibit respiration and phosphorylation by dark-grown *Rhodopseudomonas sphaeroides* membrane preps. and intact cells. The terpenoids [final concn. 5 mM (0.1%)] penetrated the cell wall and dissolved within the membrane. In general, no significant difference was obsd. in the inhibitor rates of whale cells or membrane preps. The most potent inhibitors were **thymol**, **carvacrol**, and other alc. terpenoids; monoterpene hydrocarbons were the least inhibitory. These data confirm the **bactericidal** action of terpenoids; applications in food preservation and dietary limits are discussed.

AB The essential oil fraction comprised 0.81-1.25% of the above-ground portion of *T. kotschyanus* plants. The essential oil fraction of the leaves and flowers was 2.07% of the abs. dry wt. in the massive flowering stage, 1.02% in the budding stage, and 0.66% in the fruit-bearing stage, suggesting that the flowering stage is the optimal time for prepn. of the essential oil stock. **Thymol**, **carvacrol**, borneol, cineol, linalool, and limonene were the major components of the essential oil. In a 1:1000 concn. the *T. kotschyanus* essential oil showed strong **bactericidal** and fungicidal activity against 11 common pathogenic microbes, suggesting the possible use of the essential oil in the prepn. of antiseptics and disinfectants.

AB Six chemotypes of *T. vulgaris* are described which are characterized by the major constituent (>80%) of their essential oil: geraniol [106-24-1], linalol [78-70-6], .alpha.-terpineol [98-55-5], thujan-4-ol [17699-16-0], **carvacrol** [499-75-2], or **thymol** [89-83-8]. The 6 essential oils showed approx. the same antimicrobial activity against the **bacteria** and fungi tested with the exception of *Pseudomonas* which showed only very weak sensitivity. The **thymol** oil was the most active, followed by **carvacrol** and geraniol. Linalol showed activity similar to that of geraniol. The remaining 3 oils were much less active.

AB Seventy-three phenols were synthesized and tested for activity against pathogenic **bacteria** and fungi, and the most active compds. were hexachlorophene, 2,4,5-trichlorophenol, 4-tert-butylphenol, pentachlorophenol, Ovitrol, and Preventol. These substances also had good activity against **bacteria** in x-ray film production materials. Me, halogen, and nitro substitution increased microbiostatic activity, while amino and hydroxyl groups, when compared to unsubstituted phenols, decreased activity. Substitution with strong hydrophilic agents, such as sulfonic acid, gave a product with no activity.

AB p-Amino-p'-nitrodiphenyl sulfide is acetylated with Ac₂O-AcOH, then oxidized with Na₂Cr₂O₇-H₂SO₄ 12 hrs. at -2.degree. to give the N-Ac deriv.

of the corresponding sulfone, m. 219-20.degree.. This is hydrolyzed by refluxing for 15-20 hrs. with 16% HCl, filtered hot, and cooled, to yield the HCl salt of p-amino-p'-nitrodiphenyl sulfone, which with NaOH yields the free base, m. 168-70.degree. (from EtOH), m. 164-5.degree. (from AcOH), m. 168-9.degree. (from MeOH; the best solvent). This (2.8 g.) is triturated in 12 ml. 16% HCl, taken up in 50 ml. MeOH, the soln. cooled to 0.degree., treated with 5-5.2 ml. 2 N NaNO₂, and the pptd. emulsified diazonium salt used in situ for coupling by addn. to an alk. soln. of the coupler in 5% excess; after 4-6 hrs. the product is filtered off and repptd. from NaOH by HCl. The products obtained with the various couplers are shown as follows: PhOH, brown, m. 228-30.degree., yellow in acids, orange in alkalis, dyes wool orange, silk yellow, inactive against tuberculosis **bacteria**; o-cresol, brown, m. 173-6.degree., yellow, red, orange, yellow, active at 1:20,000 concn.; m-cresol, brown, m. 168-70.degree., yellow, red, orange-yellow, yellow, active at 1:40,000; p-cresol, brown-yellow, m. 160-2.degree., orange-yellow, red, orange-red, yellow, active at 1:20,000; 1,3,4-xyleneol, brick red, m. 180-2.degree., yellow, reddish, orange-yellow, yellow, very active at 1:2,000; 1,3,5-xyleneol, brick-yellow, m. 186-9.degree., yellow, ruby, orange, orange, very active at 1:8,000; 1,4,5-xyleneol, bright red m. 160-3.degree., yellow, orange, orange, very active at 1:3,000; 1,2,4-xyleneol, red, m. 216-18.degree., yellow, purple, yellow, apricot, very active at 1:2,500; p-HOC₆H₄-Ph, orange, m. 152-4.degree., yellow, red-pink, orange, yellow, very active at 1:8,000, p-isoamylphenol, brown, m. 163-5.degree., yellow, red, yellow, yellow, active at 1:4,000; **thymol**, brown, m. 180-3.degree., red, red, yellow, yellow, inactive; **carvacrol**, orange, m. 190-2.degree., lemon-yellow, red, yellow, yellow, active at 1:4,000; anisole, brown, does not m. 365.degree., yellow, brick-red, not absorbed by fabrics, very active at 1:40,000; resorcinol, brown, m. 223-5.degree., yellow, red, yellow, yellow, active at 1:10,000; 5-methylresorcinol, orange, m. 130-3.degree., yellow, yellow, yellow, yellow, very active at 1:5,000; 4-hexylresorcinol, brown, m. 189-91.degree., yellow, yellow, brown, brown, very active at 1:20,000; pyrocatechol, brown, m. 152-5.degree., yellow, brown, yellow, yellow, very active at 1:6,000; guaiacol, chocolate, m. 210-12.degree., yellow, red, yellow, yellow, inactive at 1:5,000; pyrocatechol mono-Et ether, brown, m. 138-40.degree., yellow, red, brick red, brick red, very active at 1:2,000; pyrogallol, red-brown, m. over 265.degree., yellow, brick-red, not absorbed by textiles, very active at 1:3,000; 1,2,4-C₆H₃(OH)₃, brown, m. 225-7.degree., brown, brown, not absorbed by textiles, very active at 1:20,000; phloroglucinol, red, m. above 365.degree., red, red, yellow, yellow, very active at 1:2,000; 1-C₁₀H₇OH, red-brown, m. 206-8.degree., yellow, red, brown, pink, inactive; 2-C₁₀H₇OH, orange-red, m. 178-81.degree., orange, red, flesh color, flesh color, very active at 1:20,000; anthrarufin, yellow, does not m. 365.degree., orange, red, orange, orange, active at 1:5,000; alizarin, brown, m. 195-8.degree., red, red, yellow, none, inactive; 8-hydroxy-9-fluorenone, red, m. 270-3.degree., pink, green, reddish, pink, inactive; 1-phenyl-3-methyl-5-pyrazolone, orange, m. 240-1.degree., yellow, red, pink, pink, inactive; 1-phenyl-2,3-dimethyl-5-pyrazolone, yellow, m. 222-4.degree., brown, brown, yellow, yellow, very active at 1:4,000; 8-quinolinol, brown, not m. 365.degree., red, red, yellow, yellow, very active at 1:4,000; p-chlorophenol, orange, m. 205-7.degree., orange, red, red, yellow, inactive; dichlororesorcinol, brick-red, m. 270-2.degree., orange, red, red, yellow, very active at 1:2,000; 6-chlorothymol, red, does not melt, orange, red, yellow, yellow, very active at 1:2,000. The products were inactive against gas gangrene, typhoid, and paratyphoid organisms.

AB The compn. of thyme oils is described. Ethers of their principal constituents were prepd. and studied. Min. lethal dose of **thymol** and of its Me, Et, Pr, iso-Pr, Bu, iso-Bu, iso-Am, and benzyl ethers in dogs was found, resp., 0.15, 1.85, 1.13, 1.92, 0.55, 1.65, 1.27, 0.30, and 1.80 g./kg. wt. The same values for **carvacrol** and its Me, Et, and Pr ethers were 0.32, 0.96, 0.71, and 0.93 g./kg. All these ethers lowered the arterial pressure. Etherification diminished the toxicity of the phenolics. Antiseptic power of these derivs. against several **bacteria** was detd. In poisoned dogs 7 to 39, av. 26.3%, of the perfused ethers was fixed in the lungs, 2.7% in the liver and 0.7% in the kidneys.

AB cf. C.A. 39, 2566.3; 40, 1228.1, 31831. Toxicity of the Me (I), Et (II) and Pr (III) ethers of **carvacrol** (IV) was studied. The ethers were prepd. by condensation in alc. medium, using Me and Et sulfates and Pr bromide, resp., with Na **carvacrolate**. In each case the product was suspended in H₂O, shaken out in petroleum ether, freed from solvent at atm. pressure, and distd. at reduced pressure. By the method of Caujolle and Franck on dogs, I and III were 1/3 as toxic as IV, and II was less than 1/2 as toxic. Respiratory irregularities and fall of blood pressure were observed. There were no convulsions. In **bactericidal** power, I, II, and III were inferior to IV, resembling the ethers of **thymol**.

AB It can be assumed that earlier attempts to find new disinfectants have been unsuccessful because it was not taken into account that a disinfectant must not only be water-sol. but also lipoid-sol. New phosphoric acid esters of phenol derivs. and their K salts were prepd. and examd. with respect to this soly. and to their suitability as disinfectants. Only mono- and di-Ph esters were prepd. because tri-Ph esters are difficultly sol. and poisonous. p-ClC₆H₄OH was refluxed with an excess of POCl₃ (0.2 mol. ClC₆H₄OH to 0.125 mol. POCl₃) in the presence of Mg cuttings at 130-40.degree. until the HCl evolution stopped. After distn. of the excess POCl₃ the product was fractionally distd. in a high vacuum. Compds. of the type (RO)POCl₂ (I) and (RO)₂POCl (II) were prepd. I, R=p-ClC₆H₄, b0.1 95-115.degree.; II, R=p-ClC₆H₄, b0.1 164-76.degree.; I, R=4-Cl-3-MeC₆H₃, b0.1, 95.degree.; II, R=4-Cl-3-MeC₆H₃, b0.1

170.degree.; I, R=4-Bu-2-MeC6H3, b0.4 128-33.degree.; II, R=4-Bu-2-MeC6H3, b0.4 219-23.degree.; I, R=4-iso-Am-2-MeC6H3, b0.1 125-33.degree.; II, R=4-iso-Am-2-MeC6H3, b0.2 215-22.degree.; I, R=4-hexyl-.omicron.-tolyl, b0.15 140-45.degree.; II, R=4-hexyl-.omicron.-tolyl, b0.1 245-52.degree.; I, R=6-chlorothymyl, b12, 168.degree.; II, R=6-chlorothymyl, b0.2 185-95.degree.; I, R=5-chlorocarvacryl, b0.6 123-5.degree.; II, R=5-chlorocarvacryl, b0.6 190-2.degree.; I, R=6-butylthymyl, b0.2 138-41.degree.; II, R=6-butylthymyl, b0.2 218-30.degree.; I, R=6-butyryl-.omicron.-tolyl, b0.2 167.degree.. Other compds. prepd. were mono(p-chlorophenyl) phosphate, m. 93.degree. (and K salt); K bis(p-chlorophenyl) phosphate; mono(p-chloro-m-tolyl) phosphate, m. 131.degree.; bis(p-chloro-m-tolyl) phosphate, m. 116.degree. (and K salt); mono(p-butyl-.omicron.-tolyl) phosphate, m. 83.degree.; K bis(4-butyl-.omicron.-tolyl) phosphate; K bis(4-isoamyl-.omicron.-tolyl) phosphate; K bis(p-hexyl-.omicron.-tolyl) phosphate; mono(6-chlorothymyl) phosphate, m. 142.degree.; bis(6-chlorothymyl) phosphate, m. 134.degree. (and K salt); mono(5-chlorocarvacryl) phosphate, m. 148.degree.; bis(5-chlorocarvacryl) phosphate (and Na salt); K bis(6-butylthymyl) phosphate; mono(4-butyryl-.omicron.-tolyl) phosphate, m. 139.degree.; K bis(4-butyryl-.omicron.-tolyl) phosphate; and K bis(6-butyrylthymyl) phosphate. No more oxo phenyl phosphates were prepd. after the **bacteriological** tests had shown that these last 2 esters are ineffective, in accordance with their small lipide soly. The salts of the other mono-Ph esters are also ineffective. Among the salts of di-Ph esters, the esters of 4-isoamyl-.omicron.-cresol, 6-chlorothymol, and 5-chlorocarvacrol had a substantial effect; the esters of 4-butyl-.omicron.-cresol and 6-butyl-thymol had a smaller effect on staphylococci. There was no effect on **bacteria coli**.

AB It has been confirmed once more that PhOH ointment, U. S. P., is nonantiseptic when tested by the official U. S. Food & Drug Administration method using Staphylococcus aureus. Ointments of hexylresorcinol, **chlorocarvacrol**, m-hydroxybiphenyl, chlorothymol, **thymol**, 3-chloro-4-hydroxybiphenyl, o-hydroxybiphenyl and .beta.-naphthol show varying antiseptic potency in the U. S. P. PhOH-ointment base. Like PhOH, p-hydroxybiphenyl, resorcinol and trinitrophenol show no antiseptic potency in the U. S. P. PhOH-ointment base. The above 12 phenols and derivs. all show substantial antiseptic potency in the following proposed

emulsion ointment base: gardinol (a mixt. of neutralized, sulfated, higher alcs.) 0.25, propylene glycol 6.00, H₂O 1.92 and white petrolatum 91.83 g. Waxes in ointment bases are deleterious by reducing the **bactericidal** potency of the ointment. PhOH ointment U. S. P. XI is devoid of antiseptic potency, while the ointment of the same strength prepd. with the proposed base produces a clear zone of inhibition 6 mm. wide.

 ORIGINAL REFERENCE NO.: 12:950h-i,951a-b
 TITLE: Survey of certain chemicals with regard to their **bactericidal** action on cholera vibrios within the bodies of experimental cholera carriers.
 AUTHOR(S): Schobl, Otto
 SOURCE: Philippine J. Sci. (1917), 12B, 215-31
 DOCUMENT TYPE: Journal
 LANGUAGE: Unavailable

AB The exptl. cholera carriers were guinea pigs, into whose gall bladders cholera vibrios were introduced by intravesicular injection. The chemicals were administered by mouth or by intramuscular injection. The following compds. were used: benzene, toluene, xylene, CHCl₃, CHBr₂, CCl₃CHO, C₆H₅COOH, resorcinol, pyrocatechol, guaiacol, gallic acid, pyrogallol, **carvacrol**, **thymol**, creosote, xyleneol, .alpha.- and .beta.-naphthol, betol, inorganic and organic salicylates. salipyrine, urotropine. camphor, eucalyptol. anethole, phenetole, terpeneol, turpentine, oils of clove, cinnamon and copaiba, quinine, emetine, salvarsan, atoxyl, Na cacodylate, As₂O₃, Sb₂O₃, MgO₃. KI, KMnO₄, HgCl, Sb tartrate, methylene blue, gentian violet, brilliant green, fuchsin, trypan red and blue. scarlet-red, chrysoidin, vesuvin, victoria blue, crystal violet. None of the drugs tested showed such prompt effect as to bring about complete sterilization of the animal's body in a short time in every case. Nevertheless there are certain indications evident of the possibility of shortening the duration of the state of cholera carrier. Indications of curative effect were obtained with pyrocatechol, guaiacol, pyrogallol, **carvacrol**, Sb₂O₂, As₂O₃ (small doses injected intramuscularly), and the organic compds. of As.
